

A Practical Demonstration of Room-Temperature

Preprint draft from the Institute of Convenient Physics

We report a repeatable teleportation effect observed after placing a brass doorknob, three AA batteries, and a sincere apology inside a calibrated cardboard enclosure.

The transferred object appeared 4.2 meters away with no detectable loss of mass, although it was noticeably annoyed and slightly warmer than the control sample.

Skeptics may object that the laboratory cat interfered with the second trial. We respond that the cat was not listed as an author and therefore cannot be held responsible.

Further work will examine whether larger payloads, such as bicycles or entire budget meetings, can be translated through the same aperture.
