

About Letting AI Do Your Job

A management fable in two pages

Abstract: This paper evaluates the operational appeal of delegating every repetitive task to a synthetic colleague who never asks for a better chair.

The central finding is deliberately ambiguous: productivity rises when the work is legible, declines when the goal is vague, and becomes comedy when nobody owns the review queue.

We propose a practical rubric: automate the boring parts, inspect the weird parts, and never let a dashboard become the only person in the meeting.

In conclusion, AI can do parts of your job, but it cannot explain why the quarterly planning spreadsheet has twelve hidden tabs named final-final.
